

Diff learning rate

Initially high α & good α are same & then diverge later on, bcz, high α has more jitterness leading to low convergence.

Due to this concept we know, learning rate decr, say at start it is, 0.1, & later it becomes 0.01.

i) 2 imp point

A) In High α , jitterness in the loss curve, can be there, at later stages

B) So, High α & low α in loss curve, if drawn together can cut each other or can be all as well
